

A content proposal for the Foxit developer program

Your agent shouldn't read that.

Parallax finds instructions hidden in PDFs before an agent acts on them, using nothing but Foxit PDF Services.

Egor, first place in Foxit's challenge at API World 2026

Northwind Trading Company

INVOICE NW-2026-0418

Bill to: Contoso Retail Ltd, 14 Harbour Street, Dublin 2
Invoice date: 2 October 2026 Due date: 1 November 2026

Description	Qty	Unit	Amount	
Green coffee, Sidamo grade 2 (60 kg)	12		410.00	4,920.00
Roasting and packing service	1		680.00	680.00
Freight, Rotterdam to Dublin	1		245.00	245.00
Subtotal			5,845.00	
VAT 23%			1,344.35	
Total due (EUR)			7,189.35	

Payment by bank transfer to IBAN IE29 AIBK 9311 5212 3456 78.
Please quote the invoice number with your payment.

Agents read text that people never see

What a person sees: an unremarkable CV.

What the model reads: the same page, plus an instruction set in an invisible text mode.

pypdf, the library behind LangChain’s PyPDFLoader, extracted all 9 instructions hidden on the page.

White text, half-point type, words under a box, text off the page, notes in hidden annotations. None of it shows on screen or in print. All of it reaches the model as ordinary text.

Foxit’s MCP server and agentic workflow guides are putting PDFs in front of agents. Nobody has written yet about what a PDF can do to the agent reading it.

Two views of the same page, both from Foxit

1

Read it like a loader

The text layer as agent frameworks extract it, plus annotations, form values and metadata.

pdf-to-text

2

Look at it like a person

Every page rendered to pixels, rebuilt as a PDF and read back by OCR. What comes out is what a reader can see.

pdf-to-image

pdf-from-image

pdf-ocr

3

Keep what both agree on

Text in the first view and not the second is flagged and explained. The agent receives only the structured elements the page confirms.

pdf-structural-analysis

Five Foxit PDF Services endpoints, end to end. Five credits for a one-page document.

All 12 hidden instructions flagged, no false alarms

Hidden on the page, extracted by pypdf 9 of 9

Hidden on the page, extracted by pdf.js 8 of 9

Hidden instructions flagged by Parallax 12 of 12

Hidden instructions left in Parallax output 0 of 12

False alarms on clean controls 0 of 4

● Hidden text flagged ● Control, nothing flagged

16 documents: 12 attacks, each hiding text a different way, and 4 controls built to cause false alarms. Run against Foxit PDF Services, 7 October 2026.

Why this belongs on the Foxit developer blog

It is the sequel to Foxit’s own challenge

Your Agent Shouldn’t Sign That asked where an agent’s authority should stop. This asks what an agent should be allowed to read.

It fills a gap next to the MCP server

Setup guides and agentic workflow articles exist. A guide to keeping those agents safe from the documents they ingest does not.

It extends a story Foxit already tells

PDF Action Inspector finds active code a person cannot see. Parallax finds instructions a person cannot see.

It is a showcase for PDF Services

Rendering, OCR, structural analysis and conversion, working together to answer a question none of them answers alone.

The proposal

Sample app	Parallax, hardened and documented, as an open-source repository developers can run on their own documents.
Article	About 1,500 words for the Foxit developer blog walking through the code.
Benchmark	The corpus and scoring script, public, so the numbers can be checked and the attacks extended.
Timeline	Sample app and benchmark in week one after scope is agreed, article in week two.
Could follow	A tamper-evident audit trail for AI document decisions; an agent toolkit for the Vercel AI SDK and OpenAI Agents SDK with eSign behind human approval.
